Chosen Problem No.- **1**
Problem Statement = Develop an application to **manage access control** to a set of applications **based on user profile**.
Solution-
We are developing a **web app**, which will have two tabs; one for the admins and the other for users.
Controls/Features provided based on profile:

The **Administrator** can *control the access* of applications of all the users. He can *give/revoke* access to applications, and *add/remove* the users.

The **User** can *access all the applications approved* by the admin specifically for them.
If users want access to any other applications that they are *not granted access to*, they can *request their admin* for access. After the admin approval, the user can access those applications.
